# Business Analysis Method for Constructing Business- AI Alignement Model

Source : https://www.sciencedirect.com/science/article/pii/S1877050920320408

This article presents the steps taken to create a Business-AI Alignment Model. The use of artificial intelligence is becoming increasingly widespread in the business world. But to function, these systems need data, which has to be collected. This task is often given to data scientists. People from both business and IT departments need to work together. In this article, the focus is on how to create an AI-based system that can be as aligned for the business side as it is for the IT side. To do this, they have taken a model that is already in use, but which needs to be modified. It's important to point out that the article presents the method for building this system, and that this method has only been tested once, so we can't claim that this method is totally optimal, although it does represent a good start.
